### Modified Kölbel Retractor, str

- Single Prong
- Straight Frame
- Blunt tips

Used most often as primary retraction following initial incisions. Ring-handled, self-retaining retractor with long sweeping arms. This version features arms in the same plane as the instrument body with single curved blunted prongs at the distal ends. Prongs are arranged at the distal portions of the delicately tapered arms and point laterally in the direction of the retraction force.
